Abstract

Diabetes, often referred to by doctors as diabetes mellitus, describes a group of metabolic diseases in which the person has high blood glucose (blood sugar), either because insulin production is inadequate, or because the body's cells do not respond properly to insulin, or both. Patients with high blood sugar will typically experience polyuria (frequent urination), they will become increasingly thirsty (polydipsia) and hungry (polyphagia).

Diabetes, often referred to as a chronic condition, describes a group of metabolic disorders in which the body has high blood glucose levels. This occurs because either the production of insulin (a hormone that helps regulate blood sugar) is inadequate, or the body's cells do not respond properly to the insulin that is present. As a result, blood sugar levels rise, and this can lead to various complications over time. Symptoms often include frequent urination, increased thirst, and hunger (polyphagia).

The meaning and origin of the word diabetes
The word diabetes comes from Greek, where it means "to pass through" or "to pass." It was first used by the Greek physician Aetios of Cappadocia in the 2nd century A.D. to describe a condition where patients were passing too much urine. The word became "diabetes" in Latin. In the 17th century, the Medieval Latin term "diabetes mellitus" was used to describe the condition, which was then simplified to "diabetes." The word "mellitus" comes from the Latin word "mellis," meaning "honey," because the urine of people with this condition was sweet like honey. The word "diabetes" alone is now used to refer to the condition, and "diabetes mellitus" is used to distinguish it from other types of diabetes, such as "diabetes insipidus," which is not related to blood sugar levels.

... During diabetes, besides hyperglycemia, a characteristic symptom of the disease is the loss of weight, especially in Type 1 diabetes. This is because lipids and proteins are more prone to be metabolized than carbohydrates, and dyslipidemia, which, due to insulin deficiency or resistance, promotes an increase in TG accumulation in the serum and liver [40, 41]. The results from this study showed that the ethyl acetate extract was not able to lower blood glucose levels, as was reported for an ethanolic extract of the aerial parts of *E. carlinae* [10,42]. ...

... Nevertheless, the administration of the ethyl acetate extract promoted a decrease in weight loss and serum TG content. This hypolipidemic activity is in accordance with Noriega-Cisneros et al. [10], who demonstrated that the presence of stigmasterol promoted a significant decrease in serum TG content through the modulation of de novo lipogenesis and lipid absorption in the diabetic group treated with 30 mg/mL of an ethanolic extract of *E. carlinae* [40] . A decrease in hepatic TG content (Table 4) was also shown when an ethyl acetate extract was administered, as reported by Murillo-Villicaña et al. [44] through the administration of an ethyl acetate extract of *Justicia spicigera* in STZ-induced diabetic rats. ...

... The non-ciliated and basal cells, pseudostratified loft columnar epithelial cells make up the seminal vesicles' epithelium. Compared to the Control group, the DM group's epithelium displayed significant atrophy (Lal, 2016; Tripathi et al., 2014). The pseudostratified columnar epithelial cells appeared to have a decreasing height and declining cytoplasm, and the cell structure was totally chaotic (Moore et al., 2016; Murilo et al., 2019). ...
